

Conformity review v6

Compiles, 43 pages, body 6,784 words against 8,800, §8 empty.

Since v5

Applied: P4a (the *H3b* identification rule) and P5a (the phase design with the Pagani S_f attribution). The pool went back to 2–250Hz, and the design is now fifteen geometries in the code as well as in the text — EXCLUDE_S carries $S = 4$, so MODELS and BAYES_MODELS are both the fifteen of `tab:hfModels`, six of which have $S \nmid P$, which is what §7 and P4a claim.

Points 4 and 5 close on that. What remains is listed below, and none of it is new: it is the same four items as v5 minus the two just fixed.

Verdicts

#	Requirement	Verdict	Where it stands
1	Operator, patch identity	MET	
2	f_s , P , S , f ; lock class	MET	
3	Semantic layer	MET	
4	Falsifiable hypotheses	MET	θ_{lock} has a rule, $M1$ is oriented and two-legged, the <i>H2</i> caveat is stated, and <i>H3b</i> 's identification bar is now declared in advance.
5	Controlled experiments	MET	Design, retraining recipe, phase cap and exclusions are all stated, and the fifteen geometries are the same set in the code and in the report.
6	Behavioural + representational	PENDING	§8 empty. Appendix F still carries the three “Planned extension” subsections and the T0 D0 comment → P6a.
7	Bayesian analysis	PENDING	Everything but the numbers: specification consistent, filter disclosed, thresholds pre-registered.
8	Mitigation	PARTIAL	The geometric argument is still missing from <code>eight.tex</code> → P8b. This is the one requirement clause currently unanswered by text that exists.
9	Agentic AI	MET	P9a optional.
10	NIST AI RMF	PARTIAL	No occurrence of GOVERN, MAP, MEASURE or MANAGE in <code>ten.tex</code> prose → P10a, P10b.

Blockers

- B1.** Executive summary is Lorem ipsum, page 1.
- B2.** `autogluonChronosDatasets2024` has no bibliography entry; renders as [?] and is the only undefined reference in the log.
- B3.** §8 is empty, so §9, §10 and `tab:riskRegister` cite a section that says nothing.
- B4.** P8b: restore the geometric argument. Requirement 8 asks for a principled explanation of why the mitigation does or does not address the effect, and one clause naming the stride branch is not it.
- B5.** P10a and P10b: the RMF as structure rather than as a table column.

Two consequences of the fifteen-geometry decision

- C1.** P5b in `fix_5_to_10.tex` is now stale. It describes a clean/full/excluded split that no longer exists. Either drop it or repurpose its table as a plain record of what is excluded and why, which is still worth having: the exclusion of $S \in \{4, 5\}$ is a design choice from Deliverable 1 and the exclusion of $S \in \{15, 28\}$ follows from 480 not closing on those strides, and those are two different reasons.
- C2.** Any collected artefact from an earlier run came from a seventeen-geometry design. If the contrasts are not re-collected, the numbers that land in §8 will not match the design the report describes.

Budget

6,784 now. §8 will add roughly 700. P8b (110), P10a (142) and P10b (126) bring it to about 7,860; P6a gives 220 back if you cut the planned extension, and P9a (118) fits comfortably either way. Ceiling is 8,800.
